Where UMNH files landownership data in EMu. This is not info we share currently.

The first section is entered here in the sites modules: The current landowner is usually derived from the collector's permit. In other cases maps.

The decision authority refers to who needs to be asked if permission to do some type of activity is required. In some cases such as donated material off private land or material collected on State land- UMNH is the authority. Also, where a MOU designates UMNH as the authority. Otherwise it is the same as the LOMTOC (Land owner/ manager at time of collection) which is listed below.

These next sections link (blue fields) to the transaction module/ accession record. One needs to know which accession the specimen or artifact was linked to in order to determine the landowner/ manager at that time. In the record below, the site changed ownership over time and the table allows the history to be documented.

A question was asked "Who has a system to track land ownership that they are happy with." I would not say I'm totally happy with this system as there are holes. If a specimen or artifact is not linked to an accession, this info will not be there. If someone reads the decision authority without looking for the correct transaction, the info could be wrong. If the site record was not created, the info would not be there. As a western state museum, much of our collections, legacy and current, are off public lands where ownership information is vital. However, when designing EMu there was not a solution to this, so we developed our own. It could be improved.
